During the 1960's the question of influencing people's smoking habits was treated several times in the Norwegian Parliament. Important documents for the justification of a more restrictive policy with respect to the marketing of tobacco products "Påvirkning av røykeadferd", The Norwegian Cancer Society 1967, where the proposal to build an administration that would take care of the work on smoking and health was raised. Report to the Storting nr. 62, 1968-1969, that proposed a ban on cigarette advertising, and Recreation of the Social Committee nr. 143, 1969-1970. The National Council on Tobacco and Health was created in 1971, and the same year came "Innstilling til lov om restriktive tiltak ved omsetning av tobakkssvarer" (The Tobacco Act), enacted as law nr. 14 og March 9th 1973 and implemented from July 1st 1975.

On behalf of the National Council on Tobacco and Health Statistics Norway has since 1973 conducted smoking habits surveys as an addition to the Labour Force Surveys every 4th quarter. In 1974 and in 1975 the Smoking habits survey was conducted each quarter of the year. The purpose was to obtain information on the status and changes in Norwegian smoking habits, mainly as research material for the National Council on Tobacco and Health. From 1992 to 2004, questions on smoking habits have largely been asked in connection with Statistics Norway's Omnibus Surveys. The Travel and Holiday Surveys is a continuation of the Omnibus Surveys. The main purpose of these surveys is to identify Norwegians' travel habits, and to ensure the collection of other official statistics. Questions about smoking habits are included in these surveys.

This file contains questions about smoking habits asked in connection with the Omnibus Study, November/December 2001.

**Sampling**

**Sampling Procedure**

The sample was drawn according to SSB’s sampling plan. Consequently, the country is divided into a set of sampling areas that are then grouped in 109 strata. The sampling areas are municipalities or groups of municipalities. Municipalities with low population are merged with other municipalities, so that all sampling areas have at least 7 per cent of the total population in the strata that the area belongs to. In some cases, small municipalities that are close by populous municipalities have been merged into one area. All municipalities that have more than 30 000 inhabitants and some municipalities that have between 25 000 and 30 000 inhabitants are drawn as separate strata. The other sampling areas are stratified within each county after business structure, population density, centrality, commuting- and trade patterns, media coverage and communication. In the first step, it is drawn a sampling area from each strata. The samples that constitute separate strata are drawn with 100 per cent probability. The rest is drawn with a probability that is proportional with the population in the sampling area. In the second step, the sample is drawn by chance from the 109 sampling areas. The drawing in the second step is carried through in such a manner that the sample is self-weighting when both steps are seen in coherence.

Gross sample: 2476  
Net sample: 1626  
Response rate: 65.6%

## v45: Tob15 Slutte å røyke de neste 30 dager

### Information
- Type: discrete  
- Format: numeric  
- Range: 1-9  
- Missing: */-1/0

### Statistics
- Valid: 392 /-  
- Invalid: 1475 /-

### Pre-question
Hvis IO røyker daglig.

### Literal question
Planlegger du å slutte å røyke i løpet av de neste 30 dagene?

### Concepts
- Smoking

<table>
<thead>
<tr>
<th>Value</th>
<th>Label</th>
<th>Cases</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Ja</td>
<td>44</td>
